New Federal Data Show a Student Loan Crisis for African American Borrowers

By Ben Miller | Posted on October 16, 2017, 9:00 am

Two weeks ago, the U.S. Department of Education [provided](#) the first-ever look at long-term outcomes for student loan borrowers, including results by race and ethnicity.

<https://www.americanprogress.org/issues/education-postsecondary/news/2017/10/16/440711/new-federal-data-show-student-loan-crisis-african-american...> 1/6

The data show that 12 years after entering college, the typical African American* student who started in the 2003-04 school year and took on debt for their undergraduate education owed more on their federal student loans than they originally borrowed. This holds true even for students who finished a bachelor's degree at a public institution. One reason they might not be paying down their loans? Nearly half of African American borrowers defaulted, including 75 percent of those who dropped out of for-profit colleges.

These results show that the U.S. Department of Education cannot ignore the interaction of race and student loans. Traditionally, the agency has not collected any data on the race of borrowers, except in irregular sample surveys conducted by its quasi-independent statistical arm. Unfortunately, not collecting this information has allowed for the disparate outcomes by race to go unnoticed.

There's a Massive Racial Gap in Student Loan Defaults, New Data Show

By **KAITLIN MULHERE** October 17, 2017

African-American students who borrowed to earn their bachelor's degrees are four times more likely to default on their student loans than white peers.

That's one of the most striking findings in an analysis of new data on close to a decade of loan repayment rates. Many of the findings in the [analysis](#), by the Center for American Progress, add to previous [research showing](#) student debt is far more burdensome for black borrowers than for white borrowers.

The CAP analysis, which covered students who entered college in 2003-04, found that African-Americans, on average, had made no progress paying off their debt 12 years after enrolling. In fact, their median student loan balance had actually grown, because of interest, to 115% of the amount originally borrowed.

For white borrowers, the median balance owed 12 years later was 65% of the original balance, and it was 83% for Latino borrowers.

The statistics on default rates were just as bleak. Overall, nearly half of black borrowers defaulted, more than double the rate for white borrowers. And while completing a degree is supposed to be the best protection against defaulting on your student loans—the research covered not only four-year graduates but also dropouts, associate's degree earners and those still in school—earning a bachelor's degree didn't shield minority borrowers nearly as well as it did whites. While just 6% of white borrowers who earned a bachelor's degree defaulted on their loans, 14% of Latino borrowers did so, as did 23% of black borrowers.

Half of black student loan borrowers default, new federal data show

Submitted by Paul Fain on October 17, 2017 - 3:00am

Two analyses of newly released federal data on student loans reveal serious default problems for African-American borrowers.

Earlier this month the U.S. Department of Education's National Center for Education Statistics [published a report](#) on patterns of student loan repayment for two groups of borrowers who first enrolled in college in 1995-1996 and in 2003-2004.

Historically the department has not collected much data on student debt that can be broken out by the race or ethnic background of borrowers. The new report, however, included tools that researchers can use to compare how various groups are faring.

Two resulting analyses found a troubling picture for black students who take out loans.

Nearly half (49 percent) of all black borrowers in the 2004 group defaulted on at least one loan within 12 years, [wrote Robert Kelchen](#), an assistant professor of higher education at Seton Hall University. That default rate was more than twice that of white students (20 percent) and more than four times the rate of Asian students (11 percent).

"The differentials are still present across sector, with more than one-third of black students defaulting across all sectors while a relatively small percentage of Asian students defaulted across all nonprofit sectors," Kelchen said. "Default rates at for-profit colleges are high for all racial/ethnic groups, with almost half of white students defaulting alongside nearly two-thirds of black students."

The Center for American Progress on Monday [released a report](#) on the new numbers.

The federal data show that the typical black student who enrolled in 2004 and took on debt for an undergraduate education owed more on their student loans after 12 years than the amount originally borrowed, found Ben Miller, the senior director for postsecondary education at the center

Confounding

Center for American Progress article asserts that race and student loan defaults are associated.

- “These results show that the U.S. Department of Education cannot ignore the interaction of race and student loans”.

Suspect this result is confounded by median income, because the mechanism of not having money and defaulting on loans is well understood, whereas the mechanism of being a member of a racial group and defaulting on loans is not well understood.

Other examples of possible confounding?

- You will live longer if you drink 4 to 8 cups of coffee a day? (Well off people can afford all that coffee?)
- People with graduate degrees have 11% more brain gliomas? (Graduate degree holders live in cities?)

DATA ORIGINS

“This geographic analysis uses two primary datasets: credit reporting data on student debt from Experian and income data from the American Community Survey. The Experian data includes eight key student debt variables (see Figure 2 (@ reference 4)) aggregated from household-level microdata to the zip code level. The underlying household data are a snapshot of the entire U.S. population at a single point in time—in this case, the autumn of 2015.”

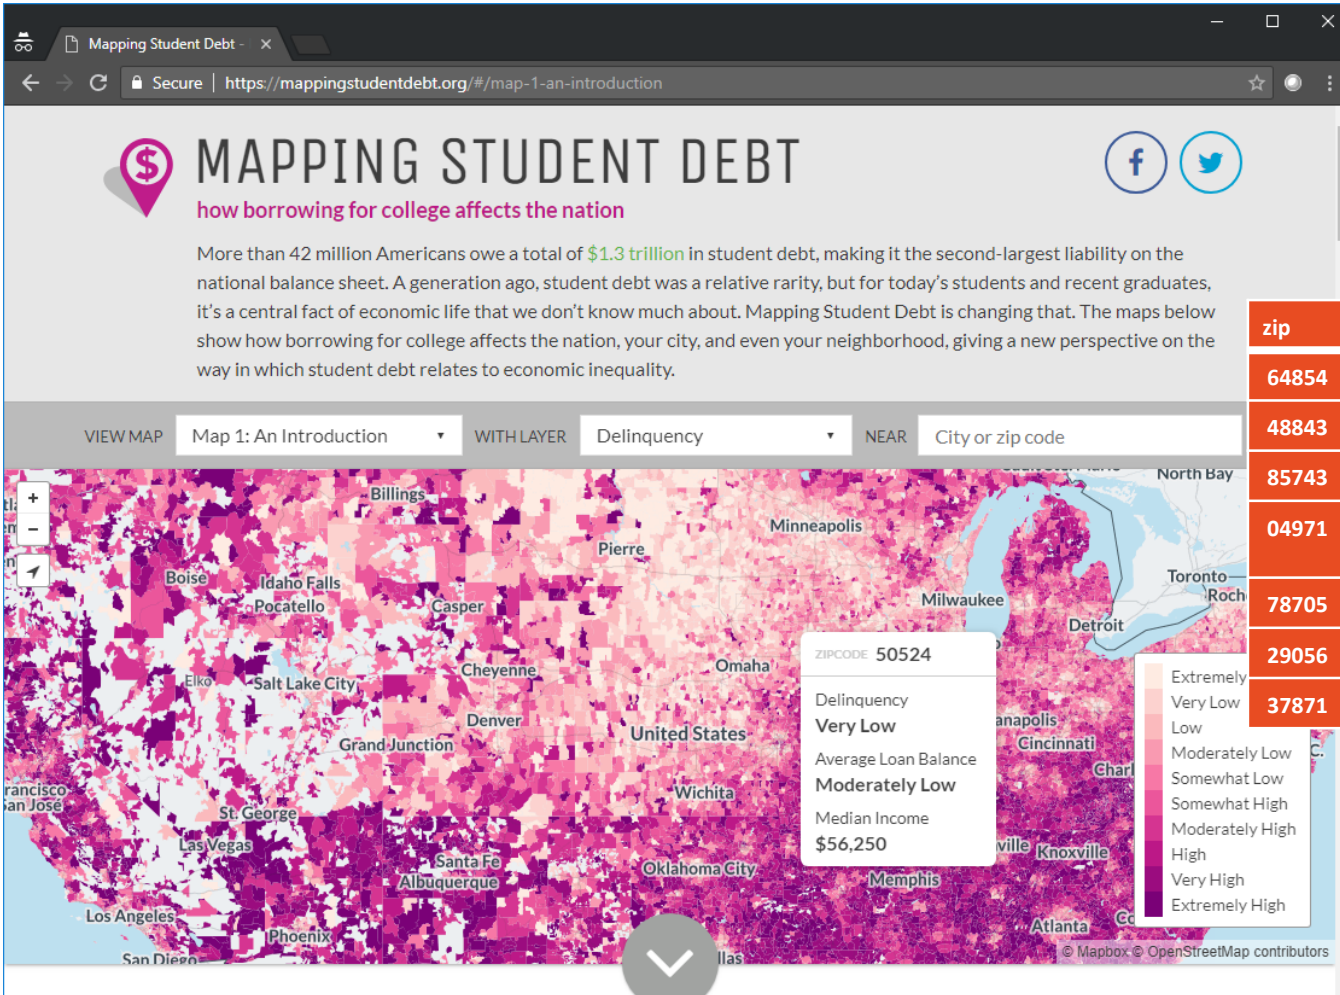

SUMMARIZED

At the Zip Code level

- Experian for student debt data
- American Community Survey for income data

As of 2015

Logistic Regression

Use Logistic regression effects plots to get some sense of the magnitude of the relative associations (not provided by the earlier tests and not provided by Odds Ratios)

```
proc logistic data=work.sd plots(only)=effect;  
    class rank_median_income2 / param=ref;  
    model rank_dn2=rank_aamerican2 rank_median_income2;  
quit;
```

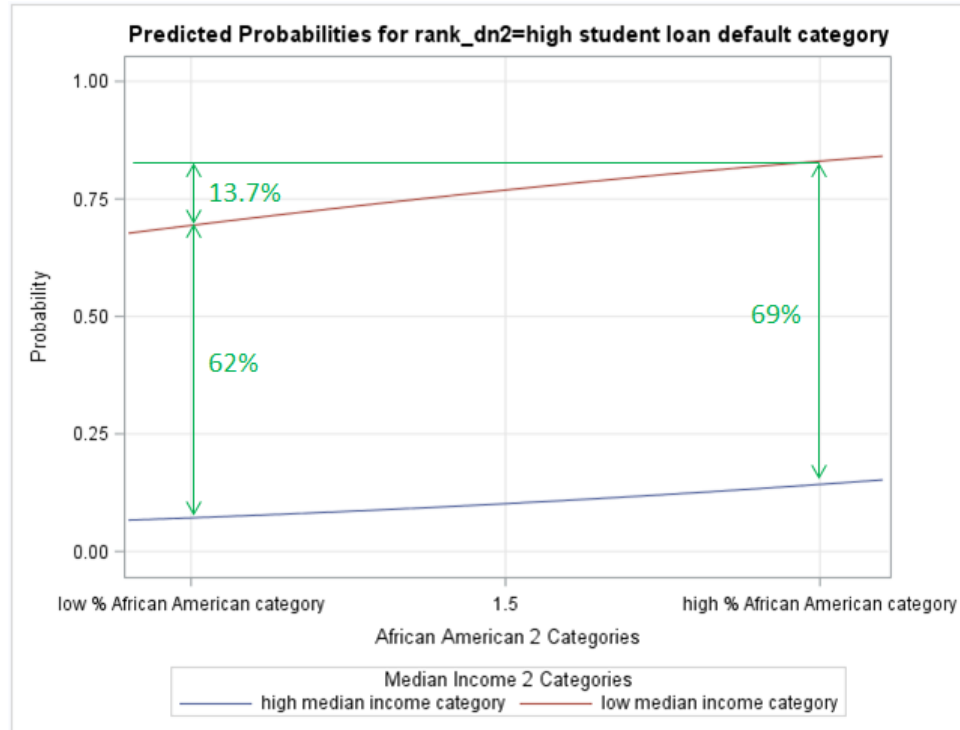

Logistic Regression

Effects plots use Maximum Likelihood Estimators (MLE) to provide probabilities for all 60 of the sample cases in the sample.

| Analysis of Maximum Likelihood Estimates | | | | | | |
|--|-----------------------------|----|----------|----------------|-----------------|------------|
| Parameter | | DF | Estimate | Standard Error | Wald Chi-Square | Pr > ChiSq |
| Intercept | | 1 | 0.8178 | 0.5357 | 2.3303 | 0.1269 |
| rank_aamerican2 | | 1 | 0.7710 | 0.7178 | 1.1536 | 0.2828 |
| rank_median_income2 | high median income category | 1 | -3.3815 | 0.7578 | 19.9140 | <.0001 |

Logistic Regression

Changes in median income category change the probability estimate of student loan default by greater than (>) 62%

Changes in African American category change the probability estimate of student loan default by less than (<) 14%

These results show that the U.S. Department of Education SHOULD ignore the interaction of race and student loans because logistic regression effects plot results show median income levels are far more associated with student loan defaults

WHY THIS MATTERS

Instinctual/Intuitive thinking vs Analytic/Rational thinking

See: Kahneman, D. (2011): Thinking, Fast and Slow
Penguin, 496 pp., ISBN 978-0141033570

Lewis, M. (2016): The Undoing Project
W. W. Norton & Company, 368 pp., ISBN 978-0393254594

Consequences of incorrect analytic conclusions

Analytic conclusions

Consequences of incorrect associations

- Approximately 40 million people in poverty in the US (2016 ACS)
 - > Approximately 8 or 9 million of those in poverty are African American.
 - > African Americans are over represented in poverty roles (by more than 2 times), but most impoverished people are NOT African American.
- A 'solution' to student loan defaults that has a focus on race (in particular African Americans) would leave out most impoverished people (perhaps 75% of the folks needing help due to poverty).

Logistic Regression MLE

$$\text{logit}(p_i) = \hat{\beta}_0 + \hat{\beta}_1 x_{1i} + \dots + \hat{\beta}_k x_{ki}$$

From SAS® online course “Predictive Modeling Using Logistic Regression (v14.2)”

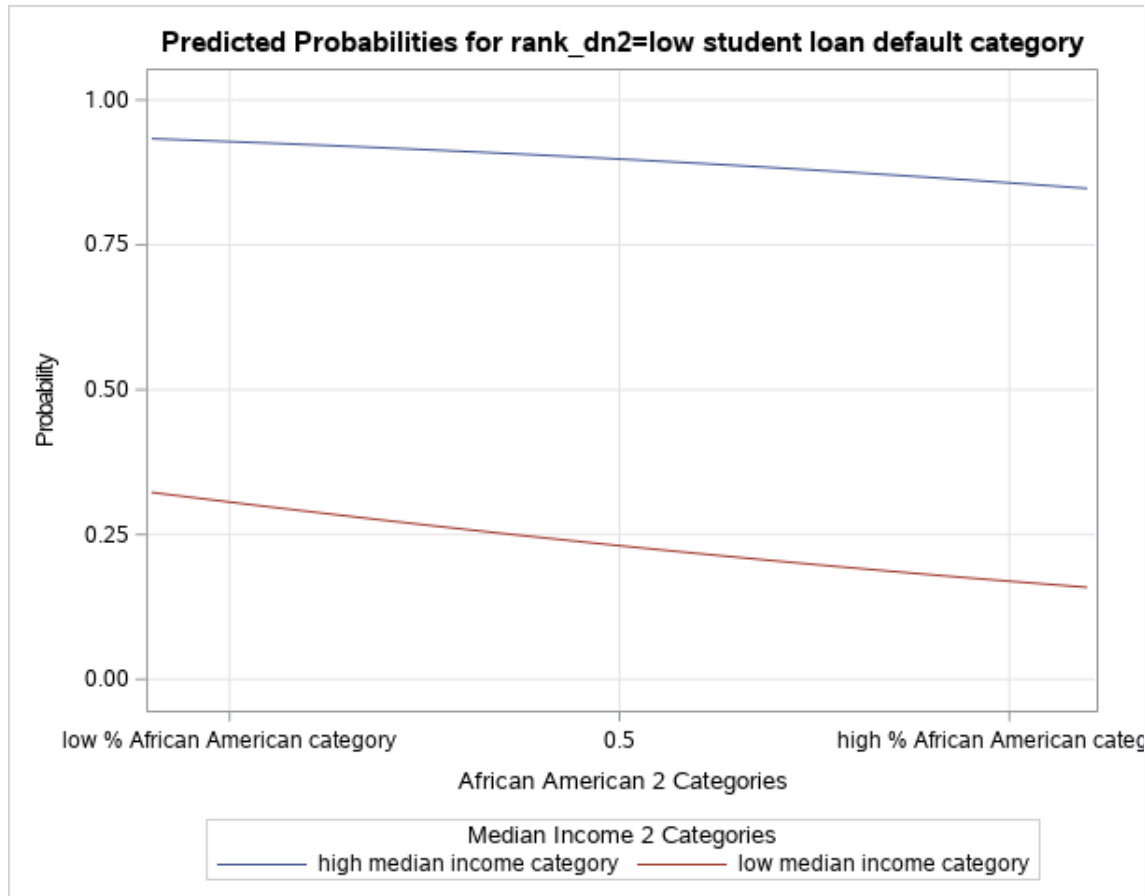

Beta hats are MLE coefficients that provide the maximum probability (likelihood) of the equation above using all 60 data points as constraints on an optimization to maximize likelihood

Intuitive explanation of maximum likelihood estimation

Maximum likelihood estimation is a method that determines values for the parameters of a model. The parameter values are found such that they maximise the likelihood that the process described by the model produced the data that were actually observed.

Logistic Regression

Effects plots use Maximum Likelihood Estimators (MLE) to provide probabilities for all 60 of the sample cases in the sample.

The effects plot just connects the dots
